

Emex® 70

Description

Emex® 70 is a high energy packaged emulsion explosive cartridge, designed for typical hard rock development, tunneling or very tough stoping conditions. The emulsion is robust and sensitisation with microspheres ensures excellent shelf-life and reliability of detonation. It is a firm, water resistant cartridge which has a formidable consistency for tamping. The high velocity of detonation (VOD) and relatively lower gas volumes (compared to ANFO and watergel) ensure finer fragmentation in tough ground whilst limiting over-break.
